STANDARD OPERATING PROCEDURE: DATA CENTER FAILOVER

NEXUS IT OPERATIONS • SOP MANUAL (SEC 12.4)

SOP Code:	SOP-OPS-2026-004	**RPO Target:**	< 5 Minutes
Owner Team:	Infrastructure Reliability Eng	**RTO Target:**	< 15 Minutes

1. PURPOSE & TRIGGER CONDITIONS

This procedure outlines execution protocol during automated or manual data center failover events from US-East primary cluster to US-West standby cluster.

2. OPERATIONAL EXECUTION STEPS

Step 1: Incident Verification (T + 0:00)
Confirm primary node outage via synthetic health monitor alerts. Lead Incident Commander declares P1 incident status on PagerDuty.

Step 2: Database Replication Lock (T + 3:00)
Issue execution command: `nexus-admin db lock --region us-east` to prevent partial write splitting across standby nodes.

Step 3: DNS BGP Route Switch (T + 7:00)
Update Anycast BGP routing tables to divert public traffic to US-West ingress gateways: `nexus-admin network failover --to us-west`.

Step 4: Post-Failover Verification (T + 12:00)
Execute automated smoke test suites. Confirm 200 OK responses across API gateway endpoints.
